Doctor Power User Documentation

User Interface Overview

The web interface is designed to be simple and user-friendly. It contains:

- A file upload section where the user selects a Power Platform solution ZIP file
- A "Generate / Analyse" button to start processing
- A preview area where generated outputs are displayed
- Download options for saving generated files locally

User Journey Explanation

Step 1: Open the Tool

The user accesses the web interface.

Step 2: Upload ZIP

The user uploads a Power Platform solution ZIP file through the UI.

Step 3: Start Generation

The user triggers the analysis process, usually by clicking a generate or analyse action. A loading indicator appears while the system processes the file.

Step 4: Send to Backend

The UI sends the uploaded ZIP to the backend using the /generate endpoint.

Step 5: Backend Processing

The backend runs the parser and generation pipeline. The user does not need to interact with any backend logic directly.

Step 6: Documentation and Diagram Generation

Outputs

The system generates several outputs based on the uploaded solution:

- Overview documentation summarising the solution
- Workflow documentation describing system processes
- Architecture diagrams showing system structure
- ER diagrams representing data relationships
- Relationship mappings between components

These outputs are displayed in the browser and can also be downloaded by the user.

Step 7: Results Returned

The backend returns the generated files to the frontend as blobs.

Step 8-9 : Preview and Download

The frontend allows the user to preview outputs directly in the browser and download them if needed.

Error Handling

The system handles common issues as follows:

- If an invalid ZIP file is uploaded, the user is prompted to upload a valid Power Platform solution
- If processing fails, an error message is displayed to the user
- If no relevant data is found, a warning is shown instead of empty outputs

Doctor power

10-Step User Journey

1. User opens the tool
2. Uploads Power Platform solution ZIP
3. Clicks generate / analyse
4. UI sends ZIP to backend via /generate
5. Backend processes the solution
6. Parser extracts apps, workflows, env vars and relationships
7. System generates documentation and diagrams
8. Backend returns outputs to frontend as blobs
9. Frontend previews results in the browser
10. User downloads outputs if needed
